Written for the short course—where content must be thorough, but to-the-point, FUNDAMENTALS OF ORGANIC CHEMISTRY, Sixth Edition, continues to provide an effective, clear, and readable introduction to the beauty and logic of organic chemistry. McMurry presents only those subjects needed for a brief course while maintaining the important pedagogical tools commonly found in larger books. With clear explanations, thought-provoking examples, and an innovative vertical format for explaining reaction mechanisms, FUNDAMENTALS takes a modern approach: primary organization is by functional group, beginning with the simple (alkanes) and progressing to the more complex. Within the primary organization, there is also an emphasis on explaining the fundamental mechanistic similarities of reactions. Through this approach, memorization is minimized and understanding is maximized. The sixth edition brings in new content that applies organic chemistry to students, for example all of the chapter openers have been changed and incorporate a model and photograph of an application of organic chemistry

such as Taxol from the Pacific yew tree. The book introduces a running application in the Interlude boxes and in the problems relating agricultural chemicals intended to unify the subject further for students. All of the problems have been reorganized by topic to make easier to assign and review. New problem categories have been added. The new problem categories are "In the Field with Agrochemicals" and "In the Medicine Cabinet" to reinforce the focus on applications.

Study Guide and Solutions Manual for McMurry and Simanek's Fundamentals of Organic Chemistry, Sixth Edition Cengage Learning

Presentation is clear and instructive: students will learn to recognize that many of the reactions in organic chemistry are closely related and not independent facts needing unrelated memorization. The book emphasizes that derivation of a mechanism is not a theoretical procedure, but a means of applying knowledge of other similar reactions and reaction conditions to the new reaction. n Brief summaries of required basic knowledge of organic structure, bonding, stereochemistry, resonance, tautomerism, and molecular orbital theory n Definitions of essential terms n Typing and classification of reactions n Hints (rules) for deriving the most likely mechanism for any reaction
