Chemical  
Nature of DNA  
A cell  
containing a  
single  
chromosome  
is placed in a  
medium  
containing  
radioactive  
phosphate so  
that any new  
DNA strands  
formed by  
DNA  
replication will  
be  
radioactive.  
The cell  
replicates its  
DNA and  
divides. Then  
the daughter  
cells (still in  
the  
radioactive  
medium)  
replicate their

DNA and divide, and a total of four cells are present.

Molecular Biology of the Gene | Campbell Biology  
10.6 The DNA genotype is

expressed as proteins, which provide the molecular basis for phenotypic traits! A gene is a sequence of DNA that directs the synthesis of a specific protein - DNA is transcribed into RNA - RNA is translated into protein! The presence and action of proteins determine the phenotype of an organism

Chapter 10 - Molecular

Biology of the Gene A. Bacterial Transformation Researchers found that they could transfer an inherited characteristic (e.g. the ability to cause pneumonia), from one strain of bacteria to another, by exposing a harmless bacteria strain to DNA extracted from a disease causing strain This process of transferring an inherited trait by an extract of DNA is called transformation
