This book addresses the two-stroke cycle internal combustion engine, used in compact, lightweight form in everything from motorcycles to chainsaws to outboard motors, and in large sizes for marine propulsion and power generation. It first provides an overview of the principles, characteristics, applications, and history of the two-stroke cycle engine, followed by descriptions and evaluations of various types of models that have been developed to predict aspects of two-

stroke engine operation.

Building the Atkinson Differential Engine Springer Science & Business Media

A computer program simulating a two-stroke diesel engine is developed and documented. The program is suitable for simulating the diesel core of a high-output combined-cycle diesel engine.

The engine cylinder and the intake and exhaust ports are defined as independent thermodynamic systems and the mass energy equations for these systems are developed. A single zone combustion model is used and perfect mixing during scavenging is assumed. The program input requirements and output results are discussed. A sample case is provided for an opposed piston, uniflow scavenged two-stroke diesel engine. The mathematical model considers the thermodynamics and fluid mechanics of the working fluid from the entrance of the intake port to the exit of the exhaust port. The program can predict the effect on engine performance of changes in parameters such as speed, boost pressure, valve timing, and fueling level. The program output provides information about power output, brake mean effective pressure (BMEP), heat transfer losses, and cylinder pressures and temperatures. The program was written in modular form so that the submodels could be modified or replaced without requiring program alteration. This report

discusses the mathematical model used in the program and describes the subroutines that make up the model. Input requirements are stated and the output listing is explained. A sample program run is also provided.

The material in the book has been presented in a very simple but effective language in order to enable students to master the subject matter thoroughly without coming across the hurdle of highly technical language. About approximately 1200 solved and unsolved examples have been incorporated. It contents 15 chapters. SI units have been consistently used throughout the book. [Alcohol as an Alternative Fuel for Internal Combustion Engines](#) Jones & Bartlett Learning Explores the opposed piston (OP) engine and provides the first comprehensive description of most opposed piston (OP) engines from 1887 to 2006. Design and performance details of the major types of OP engines in stationary, ground, marine, and aviation applications are explored and their evolution traced.

The second edition of Thermal Engineering (new name Mechanical Engineering) has been published with the hope that this edition too, would be received with the same zeal and enthusiasm as the first edition was privileged to receive earlier. In the new edition four chapters on Manufacturing Processes and chapter on Refrigeration and Air Conditioning have been added.

Needless to emphasise, this new edition has been designed as a self-learning capsule. With this aim in view the material has been organised in a logical order and lots of illustrative examples have been incorporated to enable students to thoroughly master the subject. It is believed that this book, mainly meant for under-graduate students, will captivate the attention of senior students as well as teachers.

The light-duty vehicle fleet is expected to undergo substantial technological changes over the next several decades. New powertrain designs, alternative fuels, advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards. By the end of the next decade, cars and light-duty trucks will be more fuel efficient, weigh less, emit less air pollutants, have more safety features, and will be more expensive to purchase relative to current vehicles. Though the gasoline-powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030, such vehicles will be equipped with advanced technologies, materials, electronics and controls, and aerodynamics. And by 2030, the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation, including autonomous vehicles, will be well underway. What are these new technologies - how will they work, and will some technologies be more effective than others? Written to inform The United States Department of Transportation's National Highway Traffic Safety Administration (NHTSA) and Environmental Protection Agency (EPA) Corporate Average Fuel Economy (CAFE) and greenhouse gas (GHG) emission standards, this new report from the National Research Council is a technical evaluation of costs, benefits, and implementation issues of fuel reduction technologies for next-generation light-duty vehicles. Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles estimates the cost, potential efficiency improvements, and barriers to commercial deployment of technologies that might be employed from 2020 to 2030. This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017-2025 CAFE standards.

In einer sich rasant verändernden Welt sieht sich die Automobilindustrie fast täglich mit neuen Herausforderungen konfrontiert: Der problematischer werdende Ruf des Dieselmotors, verunsicherte Verbraucher durch die in der Berichterstattung vermischte Thematik der Stickoxid- und Feinstaubemissionen, zunehmende Konkurrenz bei Elektroantrieben durch neue Wettbewerber, die immer schwieriger werdende öffentlichkeitswirksame Darstellung, dass ein großer Unterschied zwischen Prototypen, Kleinserien und einer wirklichen Großserienproduktion besteht. Dazu kommen noch die Fragen, wann die mit viel finanziellem Einsatz entwickelten alternativen Antriebsformen tatsächlich einen Return of Invest erbringen, wer dienotwendige Ladeinfrastruktur für eine Massenmarktauglichkeit der Elektromobilitätsbauten und finanzieren wird und wie sich das alles auf die Arbeitsplätze auswirken wird. Für die Automobilindustrie ist es jetzt wichtiger denn je, sich den Herausforderungen aktiv zu stellen und innovative Lösungen unter Beibehaltung des hohen Qualitätsanspruchs der OEMs in Serie zu bringen. Die Hauptthemen sind hierbei, die Elektromobilität mit höheren Energiedichten und niedrigeren Kosten der Batterien voranzutreiben und eine wirklich ausreichende standardisierte und zukunftssichere Ladeinfrastruktur darzustellen, aber auch den Entwicklungspfad zum schadstofffreien und CO₂-neutralen Verbrennungsmotor konsequent weiter zu gehen. Auch das automatisierte Fahren kann hier hilfreich sein, weil das Fahrzeugverhalten dann – im wahrsten Sinne des Wortes – kalkulierbar wird. Dabei ist es für die etablierten Automobilhersteller strukturell nicht immer einfach, mit der rasanten Veränderungsgeschwindigkeit mitzuhalten. Hier haben Start-up-seinen großen Vorteil: Ihre Organisationsstruktur erlaubt es, frische, unkonventionelle Ideen zügig umzusetzen und sehr flexibel zu reagieren. Schon heute werden Start-ups gezielt gefördert, um neue Lösungen im Bereich von Komfort, Sicherheit, Effizienz und neuen Kundenschnittstellen zu finden. Neue Lösungsansätze, gepaart mit Investitionskraft und Erfahrungen, bieten neue Chancen auf dem Weg der Elektromobilität, der Zukunft des Verbrennungsmotors und ganz allgemein für das Auto der Zukunft.

This book offers a comprehensive and timely overview of internal combustion engines for use in marine environments. It reviews the development of modern four-stroke marine engines, gas and gas-diesel engines and low-speed two-stroke crosshead engines, describing their application areas and providing readers with a useful snapshot of their technical features, e.g. their dimensions, weights, cylinder arrangements, cylinder capabilities, rotation speeds, and exhaust gas temperatures. For each marine engine, information is provided on the manufacturer, historical background, development and technical characteristics of the manufacturer's most popular models, and detailed drawings of the engine, depicting its main design features. This book offers a unique, self-contained reference guide for engineers and professionals involved in shipbuilding. At the same time, it is intended to support students at maritime academies and university students in naval architecture/marine engineering with their design projects at both master and graduate levels, thus filling an important gap in the literature.

Engineering Fundamentals of the Internal Combustion Engine Scientific Publishers

As today's spark-ignition and diesel engines have to fulfil constantly increasing demands with regard to CO₂ reduction, emissions, weight and lifetime, detailed knowledge of the components of an internal combustion engine is absolutely essential. Automotive engineers can no longer survive without such expertise, regardless of whether they are involved in design, development, testing or maintenance. This text book provides answers to questions relating to the design, production and machining of cylinder components in a comprehensive technical analysis.

The present report deals with the processes accompanying the planing of a planing boat or a seaplane on water. The study is largely based upon theoretical investigations; mathematical problems and proofs are not discussed. To analyze theoretically actual planing processes, giving due consideration to all aspects of the problem, is probably not possible. The theories therefore treat various simple limiting cases, which in their entirety give a picture of the planing processes and enable the interpretation of the experimental results. The discussion is concerned with the stationary planing attitude: the boat planes at a constant speed V on an originally smooth surface.

The project effort was focused around evaluating the friction horsepower performance of a single cylinder two-stroke opposed piston diesel engine, fabricated from conventional metal components and then with the substitution of ceramic components for the cylinder liner and pistons. The ceramic configurations were run ringless and without cylinder lubrication. Frictional torque measurements were 50% lower than in the standard baseline case.
