Environmental forensics is the application of scientific techniques
for the purpose of identifying the source and age of a
contaminant. Over the past several years, this study has been
expanding as a course of study in academia, government and
commercial markets. The US Environmental Protection Agency
(EPA), Federal Bureau of Investigation (FBI), and Federal

Emergency Management Agency (FEMA) are among the
governmental agencies that utilize the study of environmental
forensics to ensure national security and to ensure that
companies are complying with standards. Even the International
Network for Environmental Compliance and Enforcement (INECE),
a group supported by the European Commission and the World
Bank, utilizes the study of environmental forensics as it applies to
terror threats. This title is a hands-on guide for environmental
scientists, engineers, consultants and industrial scientists to
identify the origin and age of a contaminant in the environment
and the issues involved in the process. An expansion of the
authors' first title with Academic Press, Introduction to
Environmental Forensics, this is a state-of-the-art reference for
those exploring the scientific techniques available. Up-to-date
compendium for referencing forensic techniques unique to
particular contaminants. International scientific unit system
Contributors from around the world providing international
examples and case studies.

Biochar is the carbon-rich product when biomass (such as wood,

manure or crop residues) is heated in a closed container with little or no available air. It can be used to improve agriculture and the environment in several ways, and its stability in soil and superior nutrient-retention properties make it an ideal soil amendment to increase crop yields. In addition to this, biochar sequestration, in combination with sustainable biomass production, can be carbon-negative and therefore used to actively remove carbon dioxide from the atmosphere, with major implications for mitigation of climate change. Biochar production can also be combined with bioenergy production through the use of the gases that are given off in the pyrolysis process. This book is the first to synthesize the expanding research literature on this topic. The book's interdisciplinary approach, which covers engineering, environmental sciences, agricultural sciences, economics and policy, is a vital tool at this stage of biochar technology development. This comprehensive overview of current knowledge will be of interest to advanced students, researchers and professionals in a wide range of disciplines.
