A Survey on Digital Watermarking for Image Authentication ... Digital watermarking is the procedure of embedding information (i.e., a watermark) into the host object in such a way that the watermark image/data can be detected by authorized individuals, for assertion of authenticity purposes. The host signal can be a video, audio, image, 3D mesh, etc., while the watermark can be a logo, image, serial number, owner's ID, name, or any other information which shows ownership of the host signal. Watermarking Techniques used in Medical Images: a Survey. A digital watermark is a digital signal in form of pattern of bits that is inserted into the host media such as an image or audio or video file. The bits representing the watermark must. A digital watermark is called imperceptible if the original cover signal and the marked signal are perceptually indistinguishable. A digital watermark is called perceptible if its presence in the marked signal is noticeable (e.g. Digital On-screen Graphics like a Network Logo, Content Bug, Codes, Opaque images). On videos and images, some are made transparent/translucent for convenience for consumers due to the fact that they block portion of the view; therefore degrading it.
