For fans of Roshani Chokshi and Rick Riordan! "A fabulous, action-packed modern take on Indian mythology. I can't wait to read more!" -- Rick Riordan, author of the Percy Jackson series After three weeks of vacation, Ash Mistry is ready to leave the heat and dust of India behind him. Then he discovers a hidden gold arrowhead---a weapon used to defeat evil King Ravana in legend. At least, Ash is pretty sure it's only a legend . . . But when Lord Savage comes after Ash, the legends are suddenly way too real. Savage commands an army of monstrous shapechangers called rakshasas, who want only to seize the arrowhead and restore Ravana to power. As they hunt Ash through magnificent

fortresses and brutal deserts, he must learn to work with a powerful rakshasa girl named Parvati, and find the strength within himself to fight on and save the world as we know it.

This document describes the scope and general use of the space-based radar (SBR) System Model Library. The Library is a set of models that can be run on the SBR Simulation Laboratory in the functional simulation state, allowing for the detailed simulation of SBR target detection performance. The document details the seven model classes: SatControl, which controls the beam pointing direction for the SBR satellite; SatRadar, which models target detection

evaluation; StaticAntenna, which maintains information on antenna patterns and attributes; StaticPlatform, which maintains information on satellite position and velocity; SimpleASM, which receives messages from other model classes; StaticTarget, which maintains information on a target; and ClutterEnviron, which calculates ground clutter. The user interfaces to each class are described in terms of the parameters and input and output messages. A high-level description of the algorithms implemented by each model is also provided.
